## GREEN IT SOLUTIONS

### Comprehensive IT Disposal Critical Data Destruction

### IT Recycling Facts

Less than 10% of outdated computers are currently refurbished or recycled

Consumer electronics constitute 40 percent of the lead found in landfills

Electronic waste already constitutes from 2% to 5% of the municipal solid waste stream and is growing rapidly

## Comprehensive IT Disposal

At FusionOne, the proper disposal of your outdated computer equipment is not just a routine business procedure, it is a priority. To address the concerns associated with asset disposal, all recycling is done in accordance with best practices in data security and environmental stewardship. We take pride in using government certified recyclers for all materials such as batteries, wire, metals, circuit boards, toners, plastic, etc., and guarantee that all materials are diverted from landfill and recycled to North America's highest environmental standards.

With a "state-of-the-art" electronic waste recycling facility that is designed to process "end-of-life" electronic products and optimize the recovery of recyclable components such as plastic, ferrous, non-ferrous and precious metals

### Summary of disposal:

- Best practices in data security and environmental stewardship Nothing ends up in a landfill
- Comprehensive disassembly and separation
- Corporate Stewardship & Environmental Liability
- Security & Privacy of Data
- Waste Diversion & Environmental Legislation

***"One-Stop Convenience and Peace of Mind for all your E-Waste needs"***

## GREEN IT SOLUTIONS

**Comprehensive IT Disposal  
Critical Data Destruction**

### IT Recycling Facts

On average, each person discards eight dry-cell batteries per year.

It is estimated that 150 million computers will be discarded in the United States alone, enough to fill a hole one acre in area and 3.5 miles deep.

Consumers are storing an average of 2-3 obsolete computers in garages, closets and storage spaces.

## Critical Data Destruction

### DoD Data Destruction Services

Data destruction of private and confidential information is crucial to all organizations. Company policies and governmental regulations require that computer data be handled in a secure manner. From the moment a client's equipment enters our warehouse, it is digitally photographed, tracked, and monitored by around-the-clock video surveillance. As the equipment is sent across the technician's bench, asset tags are removed, and all data, programs, and operating systems are destroyed upon equipment start up. If the machine fails to power up, the hard disk is removed and physically destroyed. FusionOne also wipes data on various media types such as, thumb drives, blackberries, etc. To best meet your data destruction needs, you may select a method ranging from a one pass overwrite, to a DOD that meets specifications set by the U.S Department of Defense:

- STD - Simple one pass overwrite of entire hard drive on good working hard drive. In most scenarios, this method is sufficient for data protection, and leaves the hard drive in working condition for reuse.
- ALT1 - Magnetic Degauss destruction of magnetic domains, heads, and components on Non-working hard drives. This method completely destroys hard drive and depletes all value.
- ALT2 - Physical destruction of hard drive platters and electronics on non-working hard drives. This method completely destroys hard drive and depletes all value.
- DOD - Triple pass U.S. Department of Defense Specification. This method is the most comprehensive of all the methods and leaves the drive in working condition to maximize value.
